                                                                                                                                                                                                                                                                                                                                                                                                                                              NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft" sequence. It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                           Submitted (22-MAR-2000) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Sep 30, 2001 this sequence version replaced g1:14861654.

The present invention relates to the isolation of a novel human G-protein coupled receptor (GPCR) which is related to the chemokine receptor subfamily. The CDNA and gene sequences encoding for GPCR are also given in the invention. The sequences of the invention are useful to diagnosing and treating diseases or conditions mediated by human proteinses. Such diseases include hyperpoliferative disorders.

(e.g. hyperplasia), neurological disorders (e.g. Parkinson's disease), psychiatric diseases (e.g. schizophrenia), inflammatory disorders (e.g. adult respiratory distress syndrome, ARDS). The GPCR protein is also useful for identifying a modulator of the expression of the protein. It also serves as a target for identifying agents for use in mammallan therapeutic applications, e.g. a human drug, particularly modulating a biological or pathological assays. GPCR is also useful in diagnosing a disease or predisposition to a disease mediated by the peptide, in pharmacogenomic nallysis. The sequence encodes for the novel human GPCR the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel G protein-coupled receptors (nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 55-60) and their coding sequences in the present c sequence is the coding sequence sort of protein-coupled receptor. G sequence is the coding sequences are useful for c signal transduction. The nGPCRx coding sequences are useful for signal transduction. The nGPCRx coding sequences are useful for c screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of nGPCRx in a sample is useful as diagnostic tool for diseases or identified is useful as a diagnostic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis, CNS disorders, infections such as HIV-1, metabolic and cardiovascular disorders, infections deficit disorders, moditators of nGPCRx activity have the utility for treating neurological disorders, including schizophrenia, ADHDADD (attention deficit disorders), and neuronal disorders such as Alzaheimer's disease, Parkinson's disease, migraine and senile dementia. Additional disorders include inflammatory conditions (e.g. crohn's crospiratory allments such as asthma, and inflammatory diseases e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     Baumgartner JC,
```

The invention relates to nucleic acid sequences (ABAB1529-ABAB1552) that encode G-coupled protein-receptor related polypeptides

C (ABB4522-ABB4643). The isolated polypeptides

C (CPCRX) polypeptides. The polypeptides have potential cardiant.

C (CPCRX) polypeptides. The polypeptides have potential cardiant.

C (CPCRX) polypeptides. The polypeptides have potential cardiant.

C (CPCRX) polypeptides. The polypeptides have potential activity. The polypeptides can be administered therapeutically, especially using gene therapy and expressing the encoding DNA in vivo, to treat or prevent C GPCRX-associated disorders, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atheroscierosis, disorders cobssity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple cobssity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple cobssity, anorexia, disorders, neurodegenerative disorders, developmental diseases, neurological disorders, developmental diseases, neurological disorders, bacterial, fungal, protozoal and viral infections (e.g. with human communication and protocoal and viral infections (e.g. with human communication and protocoal and viral infections (e.g. with human communication and propeptide expression levels relative to detecting alterations in polypeptide expression levels relative to control samples. They are useful to identify agents binding polypeptide (e.g. cellular receptors or downstream effectors) and/or agents

C anticol and allored and a antagonists and agonists in disease treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to nucleic acid sequences (ABA81529-ABA81552) that encode G-coupled protein-receptor related polypeptides (ABB44522-ABB44543). The isolated polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the sequences) polypeptides. The polypeptides have potential cardiant, antitarteriosclerotic, anabolic, cytostatic and antiviral activity. The

therapy and expressing the encoding DNA in vivo, to treat or prevent CC CPCRX-associated disorders, especially in humans. For example, they can be used to treat,prevent cardiomyopathy, atherosclerosis, disorders related to signal processing and metabolic pathway modulation (e.g. related to signal processing and metabolic pathway modulation (e.g. obesity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple sclerosis, asthma, cancers, neurodegenerative disorders, immune disorders, disease, parkinson's disorders, immune disorders, bacterial, fungal, protozoal and viral infections (e.g. with human immunodeficiency virus (HIV)-1 or HIV-2). They can be used diagnostically to detecting alterations in polypeptide in mammals (especially humans) by detecting alterations in polypeptide in mammals (especially humans) by detecting alterations or downstream effectors) and/or agents modulating callular receptors or downstream effectors) and/or agents modulating callular polypeptide expression or activity, useful as antagonists in disease treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        420

The invention relates to human G-protein coupled receptor (GCREC)

polypeptides and polynucleotides. GCREC polypeptides are useful in

screening compounds that modulate their activity. They are useful in

the diagnosis, prevention and treatment of disorders which include

cell proliferative disorders such as arteriosclerosis, hepatitis,

myelofibrosis, psoriasis and cancer including adenocarchoma, leukaemia,

lymphoma; neurological disorders such as epilepsy, ischaemic

cerebrovascular disease, Alzheimer's disease, Pick's disease, dementia,

parkinson's disease, ataxias, multiple sclerosis, bacterial and viral

meningitis, Creutzfeldt-Jakob disease, schizophrenic disorders, amnesia;

cardiovascular disorders such as arteriovenous fistula, atherosclerosis,

hypertension, vascular tumours, myocardial infarction, hypertensive

cardiovascular disorders such as dysphagia, peptic ossophagitis,

cardiovascular disorders such as dysphagia, peptic ossophagitis,

dastrointestinal disorders such as dysphagia, peptic ossophagitis,

constipation, acquired immune deficiency syndrome (AIDS), hepatic

constipation, acquired inmune deficiency and acquired in accordance and observing and active acquired in accordance as infection caused by viral agent classified as adenovaries, and and the appropriations and tanman in metabolic disorders such as and fection caused by viral agent classified as adenovaries, areavitures, bunyavirus, bunyavi

The invention describes a novel isolated polynucleotide (I) encoding a human HM74-like GPCR are useful for modulating the activity of that regulate HM74-like GPCR are useful for modulating the activity of the regulate HM74-like GPCR are useful for modulating the activity of the protein in a disease selected from bacterial, fungal, protozoan, and (C) issase, cardiovascular disease, hypotension, publication, allowed from bacterial asthma, central nervous system (CNS) disease, cardiovascular disease, hypotension, hypotension, angina pectoris, myocardial infarction, urinary retention, osteoporosis, culcar, asthma, inflammation, allergy, benign prostatic hypertrophy.

CC ulcar, asthma, inflammation, allergy, benign prostatic hypertrophy, comittiple sclerosis and dyskinesia such as Huntington's disease and Tourette's syndrome. The composition is also useful for treating cortic and neurological disorders such as anxiety, schizophrenta, manic depression, delirium, dementia and severe mental retardation. (I) corticated diseases. (I) is useful in a diagnostic assay for detecting diseases, susceptibility to diseases and abnormalities related to the core and the core of mutations in the nucleic acid sequences which may act as agonists or antagonists at the receptor site and which can be regulated to provide therapeutic effects. The polypeptide is also useful as a bait corticum in a two-hybrid or three-hybrid assay, and to immunise a mammal cortic production of polyclonal antibodies. This sequence encodes the human cortical corti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated polynucleotide, useful for treating infection, pain, cancer, asthma, hypertension, myocardial infarction, urinary retention, osteoporosis, encodes the human HM74-like G-protein coupled receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180

The present invention relates to the isolation of a novel human G-protein coupled receptor (GPCR) which is related to the chemokine receptor coupled receptor (GPCR) which is related to the chemokine receptor (GPCR) which and gene sequences encoding for GPCR are also given in the invention. The sequences of the invention are useful conditions and treating diseases or conditions mediated by human proteases. Such diseases include hyperproliferative disorders (e.g. Parkinson's disease), ce.g. whyperplastal, neurological disorders (e.g. Parkinson's disease), ce.g. chizophrenia), inflammatory disorders (e.g. adult respiratory disorders (e.g. distress syndrome, ARDS). The GPCR protein is also useful for identifying a modulator of the expression of the protein. It also serves as a target or identifying agents for use in mammalian therapeutic applications, ce.g. a human drug, particularly modulating a biological or pathological response in a cell or tissue that expresses the protein, in biological assays related to GPCRs that are related to members of the chemokine receptor subfamily, in drug screening assays and in competition binding assays. GPCR is also useful in diagnosing a disease or predisobsition to a disease mediated by the peptide, in pharmacogenomic analysis. The polynucleotide sequences can also be used in gene therapy. The present contract of the numan GPCR gene sequence of the invention.

The invention relates to nucleic acid sequences (ABAB1529-ABAB152) that encode G-coupled protein-receptor related polypeptides having a sequence differing to the soluted polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the sequences (or mature forms of the sequences), fully defined in the complete receptor X (GPCRX) polypeptides. The polypeptides have potential cardiant, antiarteriosclerotic, anabolic, cytostatic and antivital activity. The polypeptides can be administered therapeutically, especially using gene therapy and expressing the encoding DNA in vivo, to treat or prevent credited disorders, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atherosclerosis, disorders callomyopathy, atherosclerosis, disorders of chesity, anorexia) diabetes, osteoporosis, Crohn's disease, multiple sclerosis, asthma, cancers, neurodegenerative disorders, macropoietic disorders, developmental diseases, neurological disorders, bacentopoietic disorders, developmental diseases, neurological disorders, confremine the presence of or predisposition to a disease associated with altered levels of the polypeptide expression levels relative to control samples. They are useful to identify appears of the polypeptide expression levels relative to control samples. They are useful to identify appears of the polypeptide expression levels called to control samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120 CTGCTCATTGTGGCCTTTGTGCTGGGGGCGCACTAGACAATGGGGTCGCCCTGTGTGTTTC 179

The present invention relates to novel G protein-coupled receptors

(nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27,

28, 31-38, 40, 41, 53-60) and their coding sequences. The present

sequence is the coding sequence for one such G protein-coupled receptor.

GPCRs are also known as seven transmembrane receptors and function in

signal transduction. The nGPCRx coding sequences are useful for

signal transduction, apecifically schizophrenia. nGPCRx are useful for

creening a human to diagnose a disorder affecting the brain or a genetic

predisposition, specifically schizophrenia. nGPCRx are useful for

conferex in a sample is useful for treating schizophrenia. Detection of

disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis,

CNS disorders, infections such as HIV-1, metabolic and cardiovascular

disorders, infections such as HIV-1, metabolic and cardiovascular

disorders, infections such as HIV-1, metabolic and cardiovascular

chiseases, proliferative disorders and hormonal disorders, modulators of

nGPCRx activity have the utility for treating neurological disorders,

including schizophrenia, ADHD/ADD (attention deficit-hyperactivity

disorder/attention deficit disorder), and neuronal disorders such as

Alzheimmer's disease, parkinson's disease, migraine and semile dementia.

Additional disorders include inflammatory conditions (e.g. Crohn's

disease), rheumatoid arthritis, autoimmune disorders, cancers,

conditional disorders and hormonal disorders, cancers,

conditional disorders and hormonal disorders e.g.
                                                                     signal transduction; schizophrenia; thyroid disorder; renal failure; rheumatoid arthritis; CNS disorder; infection; metabolic disease; cardiovascular disease; proliferative disorder; hormonal disorder; neurological disorder; neuronal disorder; Alzheimer's disease; cancer; attention deficit thyperactivity disorder/attention deficit disorder; parkinson's disease; migraine; senile dementia; inflammatory disease; rheumatoid arthritis; autoimmune disorder; respiratory ailment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ₹.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New G protein-coupled receptor (nGPCR-x) and its encoding polynucleotide useful for diagnosing and treating e.g. schizophrenia

hRUP25. The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors play in the human condition, both normal and diseased.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Endogenous and non-endogenous versions of human G-protein coupled receptors for direct identification of candidate compounds as agonists, inverse agonists or partial agonists for use as therapeutic agents -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRS, AAY90643-AAY90677 and AAA30779-A397743 and treamanness of them (AAA30779-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (TS) and transmembrane domain 6 (TM6). A non-endogenous annino acid, X, as substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence X(AA)15-Pror. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The Lib amino acid stretch between the substituted amino acid and the Promonendogenous, non-endogenous, or a mixture of endogenous and the Promonendogenous residues. The constitutively active GPCRs are useful for dentifying antagonists, agonists and partial agonists for elucidating the roles of the receptors in normal and settings for elucidating the roles of the receptors in normal and setting for elucidating the roles of the receptors in normal and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used disorders associated with the need for endogenous constitutively active, they can be used directed may be present sequence represent cDNA encoding a human wild-type GPCR used in an exemplification of the invention. This was cloned and subsequence the constitutively active, they can be used and present and present and present sequence represents cDNA encoding a human wild-type the constitution of the invention of the invention of the constitution of the invention of the constitution of the consti

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAAY90677 and AAAY90677 and AAAY90677 and AAAY9079). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (TS3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, x, is substituted for an endogenous proline in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence X (AAA)13-pro. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The IS amino acid stretch between the substituted and the Promay be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as electing for elucidating the roles of the receptors in normal and settings for elucidating the roles of the receptors in normal and conservations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for screening of compounds without the need for endogenous
Sequences AAA30709- AAA30743 and AAA30775-A30779 represent DNAs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical
                                                                                                                                                                                                                                                    DNA encoding human mutant G protein-coupled receptor HM74 (1230K).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

```
The present sequence encodes a member of the G-protein coupled receptor additions, and receptor) family, designated the HM74A receptor. The proteins, agonists, antagonists and polynucleotides can be used for treating disorders associated with increased or reduced expression or activity of HM74A, e.g. bacterial, fungal, protozoan and viral infections, particularly infections caused by HHV-1 or HIV-2, pain, cancers, diabetes, obesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, asthma, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, schizophrenia, mand depression, delirium, dementia, and severe mental retardation, and dyskinesias such as Huntington's disease or clines de la Tourett's syndrome. The products can also be used for detection, diagnosis and drug screening.
                                                                                                                                                                                                                                                      HM74A receptor; G-protein coupled receptor; infection; pain; cancer; diabetes; obesity; neurological disorder; heart failure; hypertension;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated G-protein coupled receptor, HM74A - used to develop products for treating e.g. infections, pain, cancers, diabetes, obesity, neurological disorders, heart failure, hypertension, asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mooney JL;

The present invention relates to novel G protein-coupled receptors (nGPCRx; where x 1s 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 51-60) and their coding sequences (see AAH51015 and AAH51010S and AAG80929-AAG80975 and AAG80977). The present sequence is an oligonucleotide, which was used in the present invention. GPCRs are also known as seven transmembrane receptors and thurshin in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of GPCRx in a sample is useful as a diagnostic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis, CNS disorders, infections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. New G protein-coupled receptor (nGPCR-x) and its encoding

```
ö
                                                                                                                                                                                                                                          or agenetic predisposition, specifically schizophrenia, nGPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of nGPCRx in a sample is useful for treating schizophrenia. Detection of nGPCRx in a sample is useful for treating schizophrenia. Detection of nGPCRx in a sample is useful for treating schizophrenia architis. CNS disorders, infections such as HIV-1, metabolic and architiss collaborators, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit-hyperactivity disorderfy, and neuronal disorders such as Alzheimer's disease, Parkinson's disease, migraine and senile dementia. Additional disorders include inflammatory conditions
                                                                         The present invention relates to novel G protein-coupled receptors (nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences (see AAH50699-AAH51015 and AAH5105 and AAG80929-AAG80975 and AAG80977). The present sequence is a PCR primer, which was used in an example from the present invention. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a disorder affecting the brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (e.g. Crohn's disease), rheumatoid arthritis, autoimmune disorders, cancers, respiratory ailments such as asthma, and inflammatory diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     G protein-coupled receptor; nGPCR; seven transmembrane receptor; signal transduction; schizophrenia; hybroid disorder; renal failure; rhematoid arthritis; CNS disorder; infection; metabolic disease; cardiovascular disease; proliferative disorder; hormonal disorder; neuronal disorder; attention deficit-hyperacrivity disorder; Alzheimer's disease; cancer; attention deficit-hyperacrivity disorder/attention deficit disorder: Parkinson's disease; migraine; senile dementia; inflammatory disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
polynucleotide useful for diagnosing and treating e.g. schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       rheumatoid arthritis; autoimmune disorder; respiratory ailment;

                                                                                                                                                                                                                                                                                                                                                     present sequence is an oligonucleotide, which was used in the present invention. GPCRs are also known as seven transmembrane receptors and invention in Signal transduction. The indeptx coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of indeptx in a sample is useful as a diagnostic tool for diseases or infections such as HIV-1, metabolic and cardiovascular disorders, infections such as HIV-1, metabolic and cardiovascular clientivity have the utility for treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit-hyperactivity disorders lucing disorders such as the latentian deficit disorder), and neuronal disorders such as Additional disorders include inflammatory conditions (e.g. Crohn's disease), rheumatoid arthritis, autoimmune disorders, cancers, consers,

The present invention relates to novel G protein-coupled receptors (nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences (see 28, 31-38, 40, 41, 53-60) and their coding sequences (see AAH51015 and AAH51059-AAG80975 and AAG80977). The present sequence is a PCR primer, which was used in an example from the present invention GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia.

Or a genetic predisposition, specifically schizophrenia chection of nGPCRx in a sample is useful as a diagnostic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthitis, CNS disorders, prolifections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for treating neurological disorders including schizophrenia, ADHD/ADD (attention deficit-flow hyperactivity disorder/attention deficit disorders, migraine and disorders such as Alzheimer's disease, Parkinson's disease, migraine and senile demential. Additional disorders includes and includers includes and includers includes and includers included emention deficit disorder includes and proper activity disorder. Additional disorders includes and disorders includes and disorders included inflammatory conditions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence is a PCR primer, which was used in an example from the present invention. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of nGPCRx in a sample is useful as a diagnostic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis, CNS disorders, infections such as HIV-I, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for treating neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences (see AAH51015 and AAH51105 and AAG80929-AAG80975 and AAG80977).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                     The present invention relates to novel G protein-coupled receptors

(nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27,

28, 31-38, 40, 41, 53-60) and their coding sequences (see
ANH50869-AAH51015 and AAH5105 and AAG80929-AAG80975 and AAG80977). The
present sequence is a PCR primer, which was used in an example from the
present invention. GPCRs are also known as seven transmembrane receptors
and function in signal transduction. The nGPCRx coding sequences are
useful for screening a human to diagnose a disorder affecting the brain
cor a genetic predisposition, specifically schizophrenia. nGPCRx are
useful for identifying compounds useful for treating schizophrenia.

Cuseful for identifying compounds useful as a diagnostic tool for
diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid
arthritis, CNS disorders, infections such as HIV1, metabolic and
cardiovascular diseases, proliferative disorders and hormonal disorders.

Modulators of nGPCRx activity have the utility for treating neurological
disorders, including schizophrenia, AHDA/DD (attention deficit.
hyperactivity disorder/attention deficit disorder, and neuronal
cardiovascular disease, proliferative disorder, and neuronal
disorders such as Alzheimer's disease, Parkinson's disease, migraine and
senie dementia. Additional disorders include inflammatory diseases
cancers, respiratory aliments such as asthma, and inflammatory diseases
e.g. inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        G protein-coupled receptor; nGPCR; seven transmembrane receptor; signal transduction; schizophrenia; thyroid disorder; renal failure; rheumatoid arthritis; CNS disorder; infection; metabolic disease; cardiovascular disease; proliferative disorder; hormonal disorder; neurological disorder; neuronal disorder; Alzheimer's disease; cancer; attention deficit. The present invention relates to novel G protein-coupled receptors (nGPCRx: where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences (see 28, 31-38, 40, 34, 51-60) and their coding sequences (see present sequence is a PCR primer, which was used in an example from the present sequence is a PCR primer, which was used in an example from the present invention. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a than an of diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia.

Or a genetic predisposition, specifically schizophrenia checking in a sample is useful as a diagnostic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthitis, CRS disperders, infections such as HIV1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit-disorders, understunders and alsorders and disorders 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (e.g. Crohn's disease), rheumatoid arthitis, autoimmune disorders, cancers, respiratory aliments such as asthma, and inflammatory diseases e.g. inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         G protein-coupled receptor; nGPCR; seven transmembrane receptor; signal transduction; schizophrenia; thyroid disorder; renal failure; rheumatoid arthritis; CNS disorder; infection; metabolic disease; cardiovascular disease; proliferative disorder; hormonal disorder; neurological disorder; neuronal disorder; Alzheimer's disease; cancer; attention defilict hyperactivity disorder/attention defilict disorder; Parkinson's disease; migraine; senile dementia; inflammatory disease; rheumatoid arthritis; autoimmune disorder; respiratory ailment;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25-MAY-2001
                                                                                                                                                                                                                                                                                                                                                                                        Synthetic.
                                                                            AAH51051;
                      AAH51051/c
                                                                            The present invention relates to novel G protein-coupled receptors

(nGPCRX: where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27,
28, 31-38, 40, 41, 53-60) and their coding sequences (see
28, 31-38, 40, 41, 53-60) and their coding sequences (see
present sequence is a PCR primer, which was used in an example from the
present invention. GPCRs are also known as seven transmembrane receptors
and function in signal transduction. The nGPCRx coding sequences are
useful for screening a human to diagnose a disorder affecting the brain
or a genetic predisposition, specifically schizophrenia. nGPCRx are
useful for identifying compounds useful for treating schizophrenia.
Detection of nGPCRx in a sample is useful as a diagnostic tool for
diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid
arthritis, CNS disorders, infections such as HIV1, metabolic and
cardiovascular diseases, proliferative disorders and hormonal disorders.
Modulators of nGPCRx activity have the utility for treating neurological
disorders und schizophrenia, ADHD/ADD (attention deficit-
disorders such as Alzheimer's disease, Parkinson's disease, migraine and
senile dementia. Additional disorders include inflammatory conditions
(e.g. Crohn's disease), rheumatoid arthritis, autoimmune disorders,
cancers, respiratory aliments such as asthma, and inflammatory diseases
e.g. inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Parodi LA, Hiebsch RR, Lind P, Slightom J;

CORPCRX; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences (see AAH551015 and AAH51105 and AAH680975 and AAG80977. The present sequence is an oligonucleotide, which was used in the present invention. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful consention in signal transduction. The nGPCRx coding sequences are useful consention in signal transduction. The nGPCRx coding sequences are useful consenting a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. Detection of conference in conference in sample is useful for treating schizophrenia. Detection of disorders infections such as HIV-1, metabolic and cardiovascular cliseases, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for treating neurological disorders of nGPCRx activity have the utility for treating neurological disorders.

                                                                                                                                                                                                                                                                                        The present invention relates to novel G protein-coupled receptors

(nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences (see

28, 31-38, 40, 41, 53-60) and their coding sequences (see

AAR15096-AAH51015 and AAH51015 and AAG80929-AAG80975 and AAG80977). The

present sequence is an oligonuclectide, which was used in the present

invention. GPCRs are also known as seven transmembrane receptors and

function in signal transduction. The nGPCRx coding sequences are useful

for screening a human to diagnose a disorder affecting the brain or a

genetic predisposition, specifically schizophrenia. nGPCRx are useful

for identifying compounds useful for treating schizophrenia. Detection of

CRS disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis,

CRS disorders, infections such as HIV-1, metabolic and cardiovascular

diseases, proliferative disorders and hormonal disorders. Modulators of

crock at including schizophrenia, ABHPARD (attention deficit disorders), and neuronal disorders such as

Alzheimer's disease, Parkinson's disease, migraine and senile dementia.

CR Additional disorders include inflammatory conditions (e.g. Crohn's

The present invention relates to novel G protein-coupled receptors

(nGPGRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27,

(28, 31-38, 40, 41, 53-60) and their coding sequences (see
ANH50969-ANH51015 and ANH51105 and AAG80975 and AAG80977). The
present sequence is a PCR primer, which was used in an example from the
present invention. GPCRs are also known as seven transmembrane receptors
and function in signal transduction. The nGPCRs coding sequences are
useful for screening a human to diagnose a disorder affecting the brain
or a genetic predisposition, specifically schizophrenia. nGPCRs are
useful for identifying compounds useful for treating schizophrenia.

C a genetic predisposition, specifically schizophrenia chiscopters
or a genetic predisposition, specifically as a diagnostic tool for
diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid
cardiovascular diseases, proliferative disorders and hormonal disorders
c disorders, infections such as HIV-1, metabolic and
cardiovascular diseases, proliferative disorders and hormonal disorders
disorders, including schizophrenia, ANHD/ADD (attention deficition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hyperactivity disorder/attention deficit disorder), and neuronal disorders such as Alzheimer's disease, Parkinson's disease, migraine and senile dementia. Additional disorders include inflammatory conditions (e.g. Crohi's disease), rheumatoid arthritis, autoimmune disorders, cancers, respiratory ailments such as asthma, and inflammatory diseases e.g. inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vogeli G, Wood LS, Parodi LA, Hiebsch RR, Lind P, Slightom J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                             The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliocating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (anti-agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune cancers e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disonders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral snoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.w1po.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                            Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryottes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLiol3640-ABLiol575) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 exon
                                                                                                                                                                                                                              Key
The invention relates to novel isolated polypeptides (I); and display to (I) are useful for displaying languages (II). (I), (II) and the antibody to (I) are useful for displaying inmunosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune transplant rejections and graft versus host disease, infectious diseases (e.g. hepatitis C), bleeding disorders, heamoglobin abnormalities and there blood related disorders (etcher blood related disorders (etcher blood related disorders (etcher blood related disorders (etcher blood related) in disorders, hyperproliferative disorders (e.g. daucher's disease, Parkinson's disease), chromosomal abnormalities (bown syndrome), ischaemic injury (e.g. stroke), renal disorders (e.g. stroke), respiratory disorders, dermacological disorders (e.g. arrhythmia), respiratory disorders, dermacological disorders (e.g. arrhythmia), respiratory disorders, dermacological disorders (e.g. arrhythmia), respiratory disorders, dermacological disorders (adsorder (inflammatory disorders), liver disorders (cirrhosis), as stimulators of B-cell responsiveness to pathogens, activators of treals, to induce higher affinity antibodies, and as a means to induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AIDS). AAS26976-AAS22800 represent novel signal transduction cpathway protein coding sequences and PCR primers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders -

The present sequence is that of genomic DNA encoding novel human low density lipoprotein binding protein 1 (LBP-1, see AAB82802).

The DNA was isolated from a human genomic library by screening with LBP-1 cDNA (see AAH26492). The open reading frame spans 4 exons. Human LBP-1 nucleic acids are among claimed polynucleotides of the invention that encode novel polypeptides, termed LBPs, capable of binding to native and methylated LDL. Also claimed are isolated LBP polypeptides, and biologically active fragments and analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in abnormality in structure or metabolism of LBP are claimed.

Characterized compositions comprising an LBP polypeptide or nucleic acid, and vaccine compositions, are also claimed.
New isolated low density lipoprotein binding polypeptide for treating, diagnosing and/or identifying therapeutic agents for atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 12619 BP; 3743 A; 2541 C; 2359 G; 3976 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wlpo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions \cdot

This nucleotide sequence encodes the 5' portion of the C195_1 protein which was isolated from a human PBMC CDNA library. The products of the polynucleotides of the invention can be used in research, detection and therapy, as they may have nutritional activity, cytokine and cell prollferation/differentiation activity. A search against the Genbank database demonstrated that this sequence has at least some homology with two ESTs identified as "ygl1906.rl Homo sapiens CDNA clone 19937 5'" and "yml5f12.rl Homo sapiens CDNA clone 48025 5'".
                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, memaropolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This cDNA clone, designated C195_1, codes for a novel secreted protein (see AAW41600) of human peripheral blood mononuclear cells (PBMC). It was isolated from a PBMC cDNA library using methods which are selective for cDNAs encoding secreted proteins. The 433 coling the polyA tail, is provided in AAV404275. C195_1, including the polyA tail, is provided in AAV404275. C195_1 is deposited as ATCC 98079, a composite clone. An additional isolate of C195_1, designated C195_4 (see AAV04274), is deposited as ATCC 98192. Both sequences can be recovered using a probe (see AAV04276). The isolated nucleic acid may be used to express recombinant secreted proteins; as a tissue/molecular weight marker; for chromosome identification; to identify possible genetic disorders; to isolate or anti-DNA antibodies; in interaction trap assays to identify sequences that encode interacting proteins etc. The secreted proteins can be used to screen compounds for biological activity; creceptors and ligands and as nutritional sources. They may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       have biological activities, e.g. cytokine, cell proliferation or differentiation activity, immunosuppressant, immunostimulant, requiation of heamatopoiesis, modulation of fertility, chemotactic, chemokinetic, haemostatic, thrombolytic, antimicrobials, analgesic, antipsoriatic, etc. No evidence is given to support any of these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid encoding secreted protein from human peripheral blood mononuclear cells - useful, e.g. as immunomodulators, antitumour agents, promoters of tissue growth, haemostatic and thrombolytic agents etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polyneptides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, itssue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                     Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune

                                                                                                                                                                                                                                                                                                                                                                              This sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting dat is given. Suggested activities include nutritional activity, tissue given. Suggested activities haematopoiesis regulating activity, tissue growth activity, activity, activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation; ss.
